CERTIFICATION PROGRAM BULLETIN

Poller 0 now optional for Tag certifications in CR11

Starting with December 2019, NFC Forum enables the certification of Tag devices with tiny antenna sizes by making testing against Reference Poller 0 optional. This policy change has been implemented with an update of the ICS that now includes the capability “TAG-P0” which, when set to “N”, will trigger the waiver request automatically and will be handled by the Certification Administrator. The Certificate will indicate whether a tag has been certified against Reference Poller 0 or not.

Please contact certification@nfc-forum.org, should you have any questions.

Thank you,

NFC Forum Compliance Committee
